[1] reports that only minor sequence differences appear to be responsible for the "acute biological effect".

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    with primary infection

Science 261, 1179-1181 (1993)

RD full staff_review

This sample has been taken from patient M, one of the seven patients (A,M,L,F,C,V,R), in the study(1). All patients had acute, self-limited symptomatic illness with measurable viremia followed by seroconversion. Patient M was a chronically infected male who subsequently transmitted the virus to patient F. The authors report that the sequences in this study are found to be uniformly macrophage-tropic and non-syncytium-inducing. The sequence for sample M clone 2, along with other patient M clones 1, 3-9, 11, and 12, is shown in alignment following the printed text entry. These gas sequences cluster with HIV-1 B subtype sequences. See also L21224-L21591 and L24161.

All patients had acute, self-limited symptomatic illness with measurable viremia followed by seroconversion. Patient F was infected by patient M via sexual transmission. The authors report that the sequences in this study are found to be uniformly macrophage-tropic and nonsyncytium-inducing. The sequence for sample F clone 10, along with other patient F clones 1-9, 11, and 12, is shown in alignment following the printed text entry. These gag sequences cluster with HIV-1 B subtype sequences. See also L21224-L21591 and L24161, L24162.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Other sequences in this set are included in the Retroviruses and AIDS Compendium (see accession 231354, 231365-231367, and 231374).

                                                                                                                                                                                                                                                                                                           The smH-4 sequence is presented in this entry with exception of the extra "a" it has at position 4529 causing a frameshift in the integrase of the pol gene. Clone smH-3 does not possess the additional "a" and has a normal pol gene. Follow-up work revealed the presence of a 36bp stretch -- coordinates 6391 to 6426 -- in the smH-4 [ref 2]. Clone H4i, without the extra 'a' in the integrase cds, is infectious.

The PBJ virus is the most acutely pathogenic primate lentivirus reported to date. The prototype shown below is a chimera derived from two PCR fragments; other chimeric clones of bel3 are 1.9 (infectious) and 1.5 (noninfectious, possibly due to a T -> C change in the rev start codon). Of the bell isolate, the B and P clones are both nonpathogenic.

PBJ-4.41 has the second NFkappa-B element found in HIV-1's but not in HIV-2's nor in the SIV's related to the HIV-2's, including the other known sooty mangabey isolate, H4, nor in the nonpathogenic B and P clones (see annotation at position 9651 below and discussion in [1], Fig. 2).

                                                                                                                                                                                                                                                                                                                                                   Recombinant clones that represent the 3' part of the genome of the human spumaretrovirus (foamy virus) were established from viral DNA (clone C55; see X05592) and cDNA (clone B52). The region common to both viral inserts comprises 817 bp (from the BamHI at bp 4548 in X05591 to the HINDIII site at bp 816 in X05592 corresondig to bp 5365 in a fusioned viral sequence. The env precursor polypeptide contains 14 pot. N-linked glycosylation sites. *source: cell.type=HSRV-infected HEL fibroblasts; clone=B52;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The SMM9 isolate when passaged through a rhesus macaque gave rise to the highly infectious SIVSMMPBJ (pbjl4) virus (see <SIVSMMPBJ), M3125 and M80193). The authors estimate that a maximal set of 57 nonsynonymous nucleotide substitutions and two insertions (one in the LTR, the other in the env cds) account for the acutely lethal phenotypic change.

HIVDJ373A 3340 bp ds-DNA VRL 31-DEC-1993 Human immunodeficiency virus type 1, DJ373 from Djibouti, proviral DNA encoding env, tat, vpU, rev, and nef genes. L23065 Louwagie,J.J., Janssens,W., Mascola,J.J., Fischer,C.L., van der Groen,G., McCutchan,F.F.E., Eddy,G. and Burke,D. Genetic diversity of the HIV-1 envelope glycoprotein Unpublished (1993) full automatic Human immunodeficiency virus type 1 (HIV-1), DJ273 from Djibouti, PCR amplification of proviral DNA from cocultivated PBMC's Human immunodeficiency virus type 1 Viridae; ss-RNA enveloped viruses; Positive strand RNA virus; env gene; envelope glycoprotein; nef gene; rev gene; tat gene; Retroviridae; (bases 1 to 3340) Hegerich, P.A., by Dr. h Laboratory

These sequences were kindly provided prior to publication by Dr. Joost Louwagie of the Henry M. Jackson Foundation Research Laborator; Rockville; Maryland. Twenty-one full length gp160 coding sequences from eight African countries (Djibouti, Gabon, Kenya, Senegal, Somalia, Uganda, Zaire, and Zambia) were sequenced and analyzed with thirty-two previously published full-length gp160 env sequences. Sequences Du258, Du259, K124, Sm365, Sm145, UG266, UG268, UG274, VI191, and VI525 have corresponding gag sequences published by Louwagie et. al. in ALDS 7, 769-780 (1993) and in the 1993 compendium. This sequence clusters with C subtype env sequences. See also accession numbers L22939-L22957 and L23064. /tissue\_type="blood"

Hirsch, V., Riedel, N. and Mullins, J.I.
The genome organization of STLV-3 is similar to that of the virus except for a truncated transmembrane protein Cell 49, 307-319 (1987)
Kestler et al.(Nature 331, 619-622 (1988)) present strong evidence that the isolates previously referred to as STLV-III AGM ([1], [2], [3]) and HTLV-IV ([4]) are not authentic, but were derived from cell cultures infected with SIV MAC-251. The reference sequence

for this entry is from [6], with exception of bases 10250-10277 which are from [3].

See also entries <SIVMM32H> and <SIVMM1A11>, independent molecu-clones from virus isolated from the same rhesus macaque that provided the virus for SIVMM251. In addition, entry <SIVMM239> shows greater than 98% homology to entry <SIVMM1A11> at the nucleotide level molecular

SIVMM251 sequence results in the coding sequence ending 4 amino acids earlier than it does in SIVMM142. Also, the variation marked at position 6377 ('aa' in K6W, 'aga' in K78) implies different amino acid sequences for those isolates from that point onward in The vpR coding region has been annotated to end near where the gene ends in the SIVMM142 sequence. A base change from 'a' at position 6443 in SIVMM142 to 't' at corresponding position 6418 in the

The tat start is annotated in agreement with the site in [4] agrees with HIV2ROD) sequence rather than at the site marked for the K78 sequence. (also in [2]

with reference [2] for the K78 sequence. This position also agrees with the rev start in the SIVMM142 sequence. However, [4] annotates the rev start at position 6354. Both of these sites are in the same frame. The sequence annotation shows two alternate 3' splice junction sites at 8743 and 8785. See reference [2]. The start codon for rev is marked at position 6504 in accordance

Clean copy of sequence [5] kindly provided by H.W. Kestler to the EMBL data library (25-FEB-1988). Computer-readable copy of sequence [6] kindly provided by J.Mullins (12-SEP-1988).

An internal stop codon is present in the env cds at positions and 8785-8787 in [1], [2], [3], [4], [6].

rhesus monkeys 17 months after infection. BK28 was originally called HTLV-4 (Nature 326, 610-613 (1997)), but it has since been found to correspond to SIVMM251. The K6W sequence [1], which was derived from isolate Mm251, contains about 25 frame shifts in gag-pol relative to this sequence. causing persistent lymphadenopathy and death [6] has shown proviral clone BK28 to be biologically active, in one out of four

protein about 36 A single base insertion at e base insertion at position 9678 results in coding region. The nef coding region in [1] about 36 residues longer than that produced n a frameshift in ] would produce a d by the other

Rm5C334, USA, UT 84132, USA Witherspoon,D.J., Doak,T.G., Williams,K., Seger,J. and Herrick,G. Selection on the protein-coding genes of the TBE1 family of transposable elements in the ciliates Oxytricha fallax and O. l (bases 1 to 354)
Doak, T.G., Doerder, F.D., Jahn, C.L. and Herrick, G.
Doak, T.G., Doerder, F.D., Jahn, C.L. and Herrick, G.
A proposed superfamily of transposase genes: transposon-like
elements in ciliated protozoa and a common 'D35E' motif
Proc. Natl. Acad. Sci. U.S.A. 91 (3), 942-946 (1994) Oxytricha fallax Oxytricha Doak, T.G., Williams, K., Direct Submission Eukaryotae; mitochondrial eukaryotes; Alveolata; Ciliophora; hypotrichs; Stichotrichida; Oxytricha. 2.2%; Similarity 60.4%; 87; Conservet Unpublished Oxytricha U89259 OFU89259 (bases 1 (bases 1 to 354) of. annotations omitted /translation="htrdlxkhllkahkkxxexexxxxxlkxlxkkkarexxxxxxxx QaxexxxvxxxrnxlxsextkimikiQykkipvlaQidldtslQsyliledsfdkkvi XDHQYAYKVYpFNYL" /transposon="TBE1"

Medical Center Dr. Rockville, MD 20850, USA
The H. influenzae sequence has been updated by R. Fleischmann. New
database matches have been assigned, product names have been
improved, and a number of frame shifts have been corrected. We
gratefully acknowledge the work of Tatusov et. al. We have
incorporated their annotation into the /notes fields of the
corresponding H. influenzae genes

	containing an expression system comprising the Murc gene can be used for the recombinant production of the polypeptide. Agonists or the Murc polypeptide are used to treat conditions requiring increased activity or expression of the polypeptide are useful for inhibiting the polypeptide e.g. bacterial (especially S. aureus) infections. They are also useful against Helicobacter pylori infections and related cancers, ulcers and gastritis. The antibacterial agents are useful to treat in-dwelling devices for infection prevention or generally as wound treatments to prevent adhesion of bacteria to matrix proteins. The Murc polypeptide is also useful for diagnosing or prognosing a (susceptibility to) disease, for raising antibodies; to identify modulators or specific receptors; in rational	eic acid - useful in diagnosis, treatment and prevention of erial infections m 1; Page 4; 39pp; English. present sequence represents a UDP-N-acetylmuramate:L-alanin present sequence represents a UDP-N-acetylmuramate.	lococcus aure	17-MAR-1999 (first entry)  10P-N-acetylmuramate:L-alanine ligase (MurC polypeptide).                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                             infection prevention or generally as wound treatments to prevent adhesion of bacteria to matrix proteins. The Murc polypeptide is also useful for diagnosing or prognosing a (susceptibility to) disease, for raising antibodies; to identify modulators or specific receptors; in rational drug design and as an immunogen for vaccines. The Murc gene sequences are useful in antisense/ribozyme therapeutics; to detect mutant Murc gene; for chromosomal mapping; to determine bacterial serotype; and for genetic immunisation. The present sequence represents a partial sequence of the Murc polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MurC gene;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              containing an expression system comprising the MurC gene can be used for the recombinant production of the polypeptide. Agonists or the MurC polypeptide are used to treat conditions requiring increased activity or expression of the polypeptide. Antagonists, inhibitory nucleic acid or competitive polypeptide are useful for inhibiting the polypeptide e.g. bacterial (especially S. aureus) infections. They are also useful against Helicobacter pylori infections and related cancers, ulcers and gastritis. The antibacterial agents are useful to treat in dwelling devices for the number of the polypeptide are useful to treat in dwelling devices for the actions.

                                The present sequence represents a protein from Streptococcus pneumoniae. The nucleic acid sequence encoding the Streptococcus pneumoniae protein can be useful in vaccines for inducing protective antibodies against Streptococcus pneumoniae, for treatment or prevention of infection e.g. pneumonia, otitis media or meningitis. Probes based on the nucleic acid are used to detect Streptococcus infection (by usual hybridisation or amplification methods), also for isolating Streptococcus genes or their allelic variants. The protein can be used similarly to detect specific monitoring infections. Antibodies which bind the protein are used to detect corresponding antigens, to purify the protein and for passive immunisation (optionally coupled to a toxin). Vaccines are administered, e.g. by injection, orally or through the skin, typically at 0.01-1000
                                                                                                                                                                                                                                                                                     pneumoniae or their epit
protective or therapeutic

PT useful in vaccines and for treatment of bacterial infections of e.g.
PT respiratory tract and central nervous system
PS Claim 11; Page 329; 390pp; English.

CC This sequence represents a Staphylococcus aureus protein of unknown
CC The DNA sequences were isolated from Staphylococcus aureus WCHU29
CC (NCIMB 40771). Host cells containing the DNA sequences are used to
CC produce polypeptides or fragments. The proteins are used in the treatment
CC of disease, for inducing an immune response by administering them, to
CC produce antibody and/or T-cell immune response. Antagonists of the
CC proteins are used for the inhibition of bacterial polypeptides.
CC conditions which may be treated include bacterial infections, especially
CC respiratory, cardiac, gastrointestinal, central nervous, eye, kidney,
CC respiratory, cardiac, gastrointestinal, central nervous, eye, kidney,
